This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1909 Excerpt: ...they work continuously until the refilling of the bed commences, in order that the latter may be entirely drained. The sewer A enters a diverting chamber in which is the storm overflow B. From the diverting chamber the sewage flows to the two detritus chambers C, the inlets to which are fitted with penstocks, so that either may be closed, and thus shut out of work when desired. From the diverting chambers the sewage enters the scum tanks 1). These are constructed with a fall towards the sludge pit G, and thus any deposit can be removed by opening the penstocks shown. The detritus chambers C are cleared in the same way. The sludge is removed from the pit G by means of any ordinary sludge pump, fixed, or removeable. The sewage is shown to enter the scum tanks D through trapped inlets, and leaves it by passing under the Adams' Patent Scum Plates F, and over weirs into the dosing chamber E. The liquid capacity of the dosing chamber E is equal to that of any of the four contact beds 1, 2, 3, 4, and ensures their rapid filling, thus allowing the greatest length of time for contact, emptying and aeration. Where, however, fall does not allow of the provision of a dosing chamber E (this need only be 6 inches deep), the chamber may be omitted and the supply taken direct from the scum tanks D to the beds by means of the feed pipe. The beds are then filled at the rate the sewage comes to the works. H shows the intake to the supply pipe to the beds (1, 2, 3, 4) in this case laid under their floor. The whole of the apparatus is arranged in a small compass in the centre of the beds. Every part is accessible and close at hand, whilst where desired the whole can be readily covered in by a simple corrugated roof or other structure. The whole of the necessary operations of fi...
